

**Computer Science Department  
San Francisco State University  
CSC 413 - Documentation Guidelines**

You are required to write project documentation, export it as a PDF, and store the PDF in the documentation folder of your GitHub repository.

**PDFs only. Do not submit Word documents for the final documentation.**

**Required Sections**

- **Title Page**
  - Name
  - Student ID
  - Class and semester
  - GitHub repository link
- **Introduction**
- **Project Overview**
  - Explain the project at a high level. Assume the audience is not familiar with the code.
- **Technical Overview**
  - Explain the project for an experienced programmer.
- **Summary of Work Completed**
  - Discuss what you contributed to the assignment and what works correctly. If anything is incomplete, list what remains unfinished.
- **Development Environment**
  - Java version used
  - IDE used
- **Build or Import Instructions**
  - Explain how to build or import the project in the IDE you used.
  - Instructions such as click the play button or import the project are not enough. Include specific steps and/or commands.
- **Run Instructions**
  - Explain how to run the project after it has been built or imported.
- **Assumptions**
  - List the assumptions made while designing and implementing the project.
- **Implementation Discussion**
  - Discuss the design choices made while implementing the assignment.
  - Include a UML class diagram of your assignment. Files related to testing do not need to be included.
- **Project Reflection**
- **Project Conclusion and Results**

**Submission Checklist**

- PDF is stored in the documentation folder.
- Repository link is included and works.
- Build/import and run instructions have been tested.
- UML class diagram is included.

- Spelling, grammar, and formatting have been reviewed.

Organization and appearance are important. Use spelling and grammar checkers; your ability to communicate about software and technology is almost as important as your ability to write software.
